in the Twenty-First Century

THOMAS PIKETTY

TRANSLATED BY ARTHUR GOLDHAMMER

Cavanaugh & Breau (2018) in a systematic review of 'geographies of inequality research' show that since 2007/8, no increase in publications focussed at urban & n'hood level, whereas substantial increase in national & regional accounts

Gini and segregation in cities – what do we know?

- ▶ Cities often break away from their national contexts: large cities are more unequal than their “host nations”
- ▶ US - income inequality POSITIVELY CORRELATED with segregation (Reardon & Bischoff 2011)
- ▶ A global trend? Increased national income inequality leads to urban segregation “almost everywhere in the world” (Tammamaru et al 2020, 2021)
- ▶ OECD 2018 data shows the richest, followed by the very poorest, are the most segregated - Segregation follows a *U-curve*

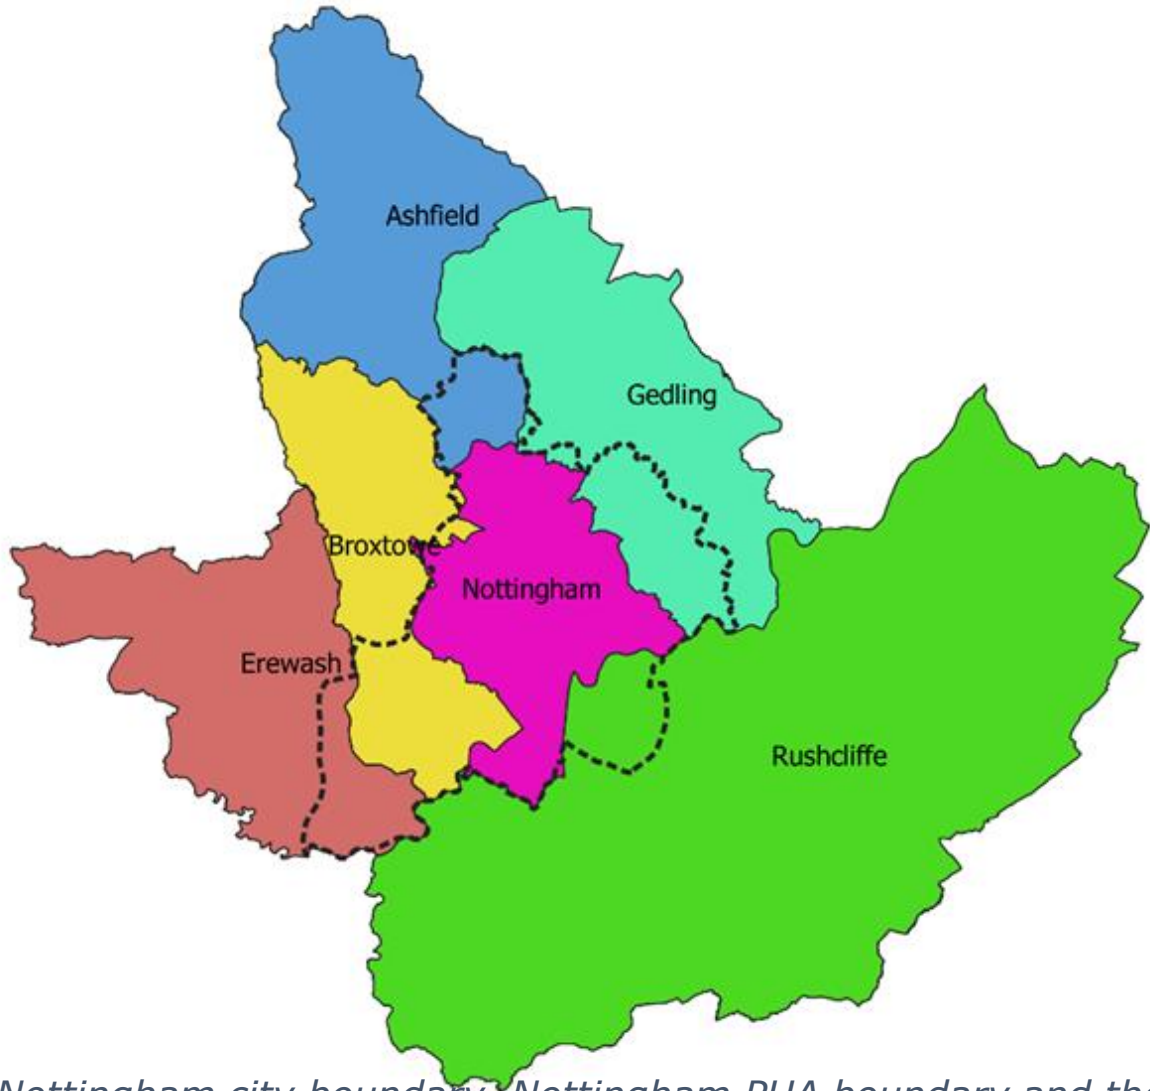

Research questions

NB Most segregation studies focus on segregation of poor households from non-poor households

1. What is the relationship between **income inequality and segregation (of high income households from low income households)**?
2. Which group is more segregated in the UK (high or low incomes)?
3. What does the Gini tell us about “sustainable” cities and neighbourhoods’?

Methods & research design

- Gini; Index of Dissimilarity (Di); Interaction Index (Massey & Denton 1988)
- Sample: core cities + regional comparators
- Detailed case study of Nottingham conurbation

Nottingham city boundary, Nottingham PUA boundary and the five suburban district boundaries that intersect the Nottingham PUA. Contains National Statistics data © Crown copyright and database right 2012

[Home](#) > [People, population and community](#) > [Personal and household finances](#) > [Income and wealth](#) > Small area model-based income estimates, England and Wales

Small area model-based income estimates, England and Wales: financial year ending 2016

Small area model-based income estimates covering middle layer super output areas (MSOAs) in England and Wales.

This is the latest release. [View previous releases](#)

Contact:
[Nigel Henretty](#)

Release date:
25 April 2018

Next release:
To be announced

To calculate the
Gini coefficient

WE FIT THE “INCOME
BAND” DATA ON UNIFORM
DISTRIBUTION AND SET THE
UPPER BOUND AT £120K
(DATASET HIGHEST BAND IS
£60K+)

Limitations

Experimental, modelled dataset – can't draw conclusions about poverty or standards of living

No historic data (can't examine trends/gentrification)

Modifiable areal unit problem

Lack of transparency of high incomes

Results

Income distribution by LSOA (England and Wales)

IN 83 % OF LSOAS, MEDIUM INCOME IS DOMINANT

IN 1 % (CA 400 LSOAS) HIGH INCOME IS DOMINANT

78 % OF LSOAS, THE NUMBER OF LOW INCOME HOUSEHOLDS IS MORE THAN 20 PER CENT HIGHER THAN THE NUMBER OF HIGH INCOME HOUSEHOLDS

National Income distribution

■ Low ■ Medium ■ High

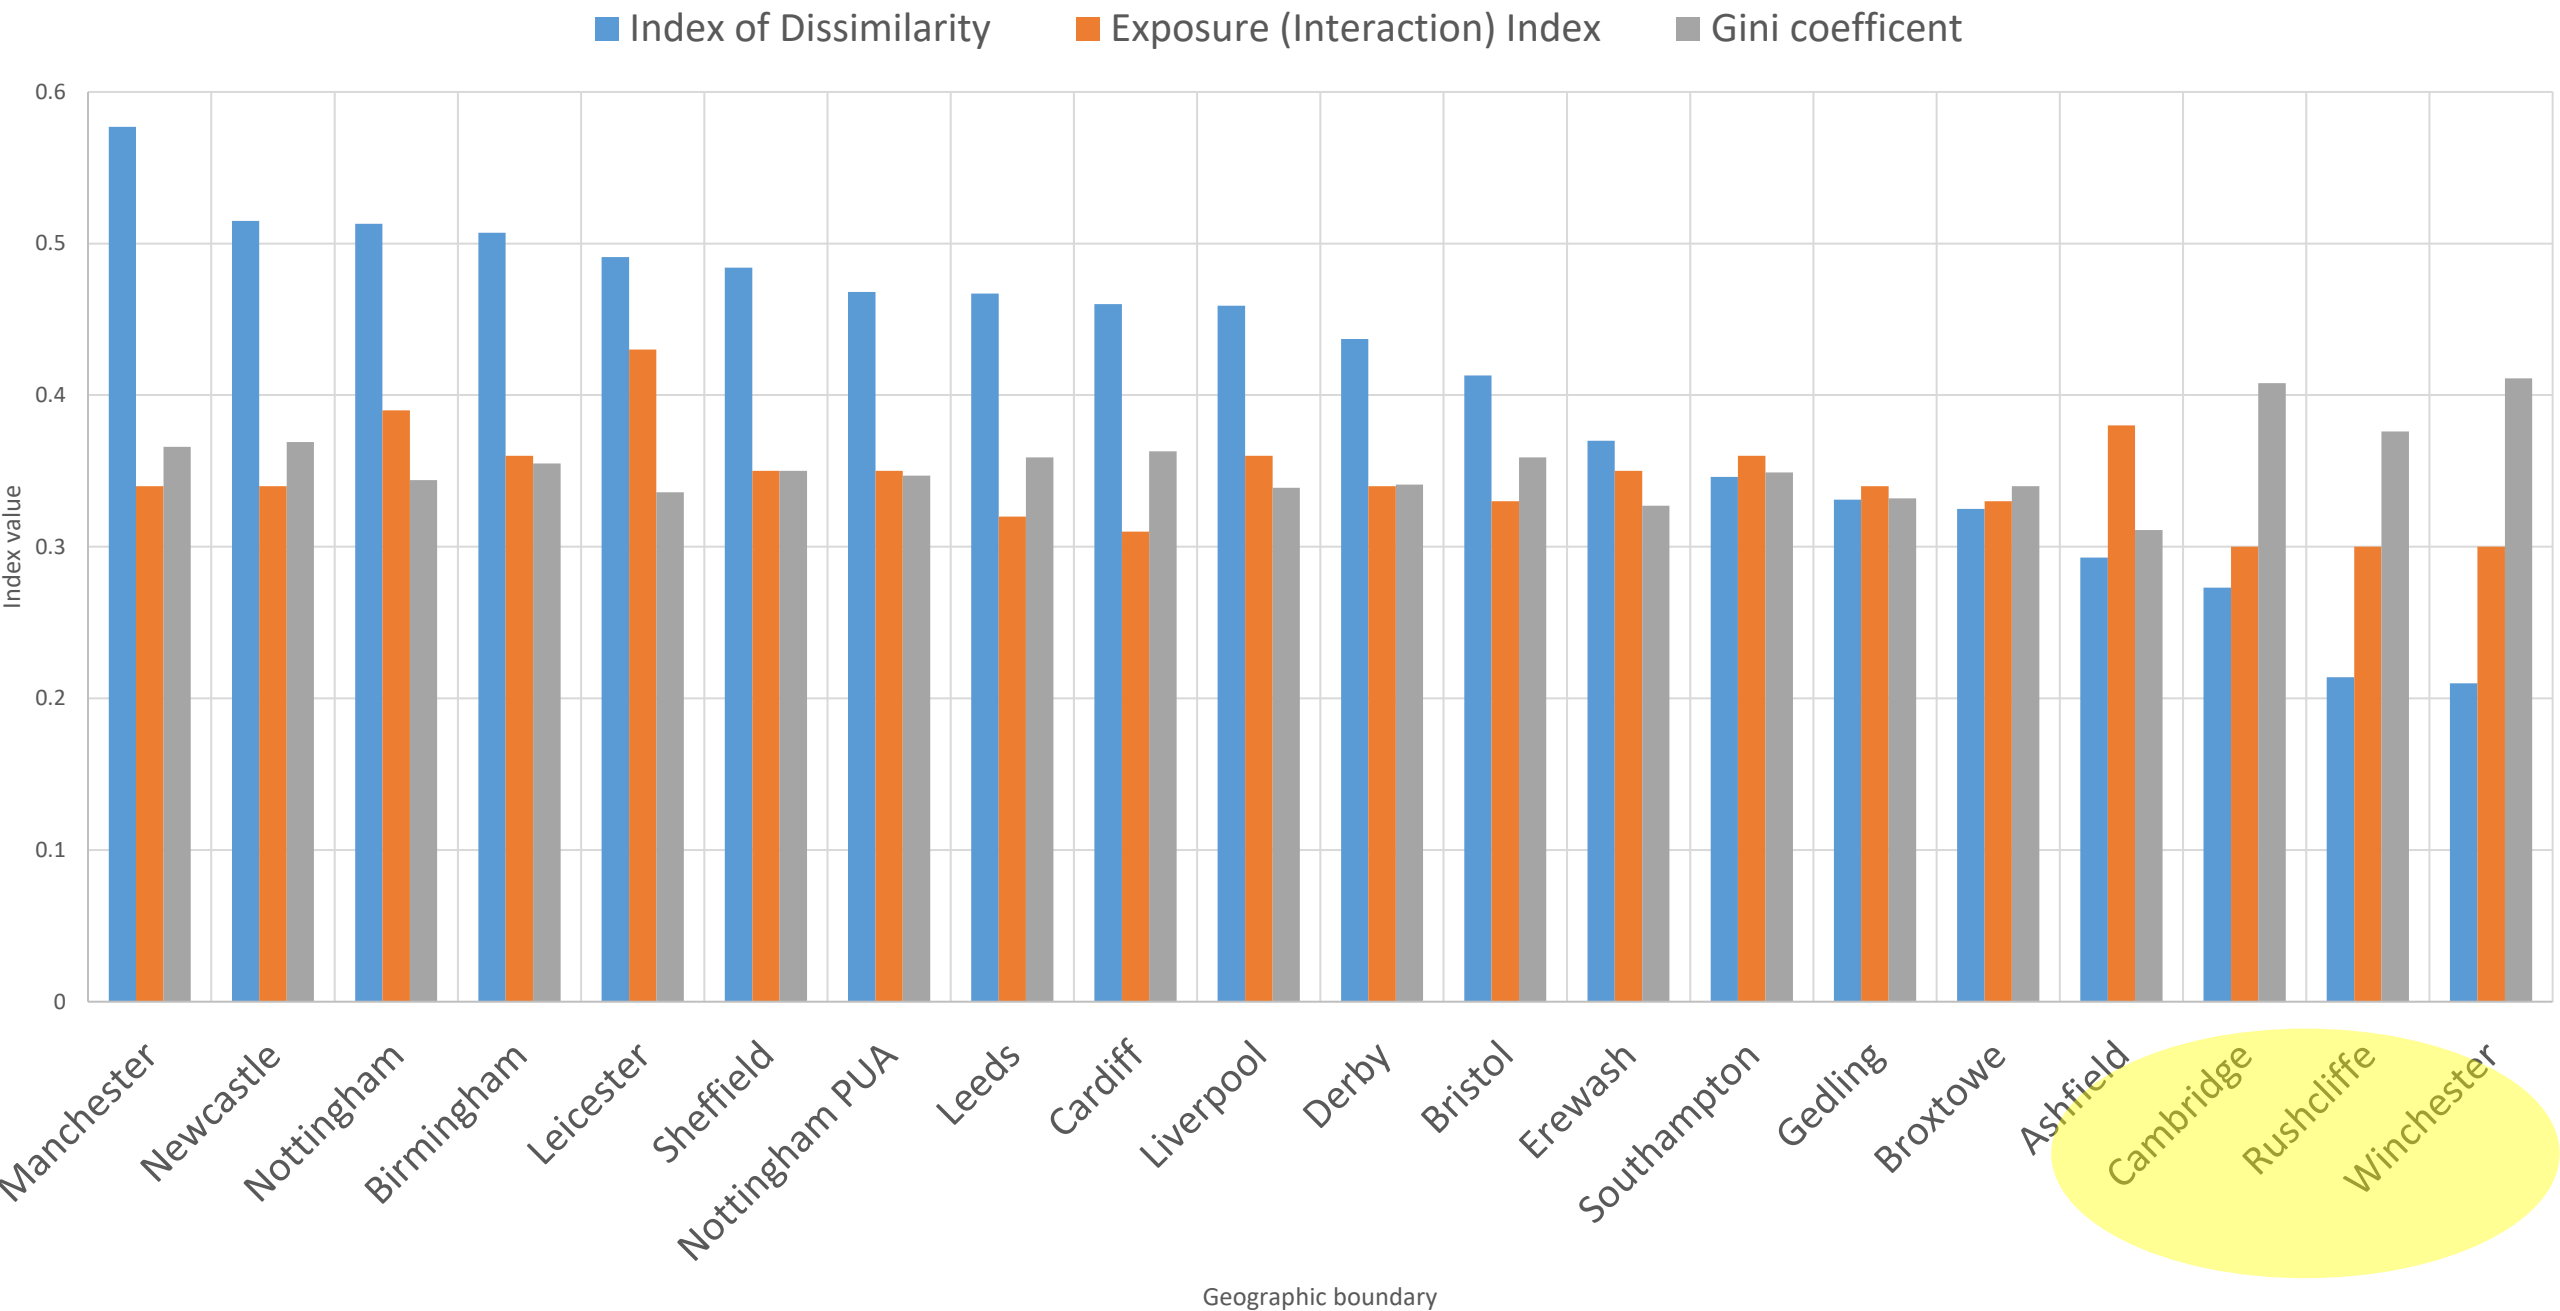

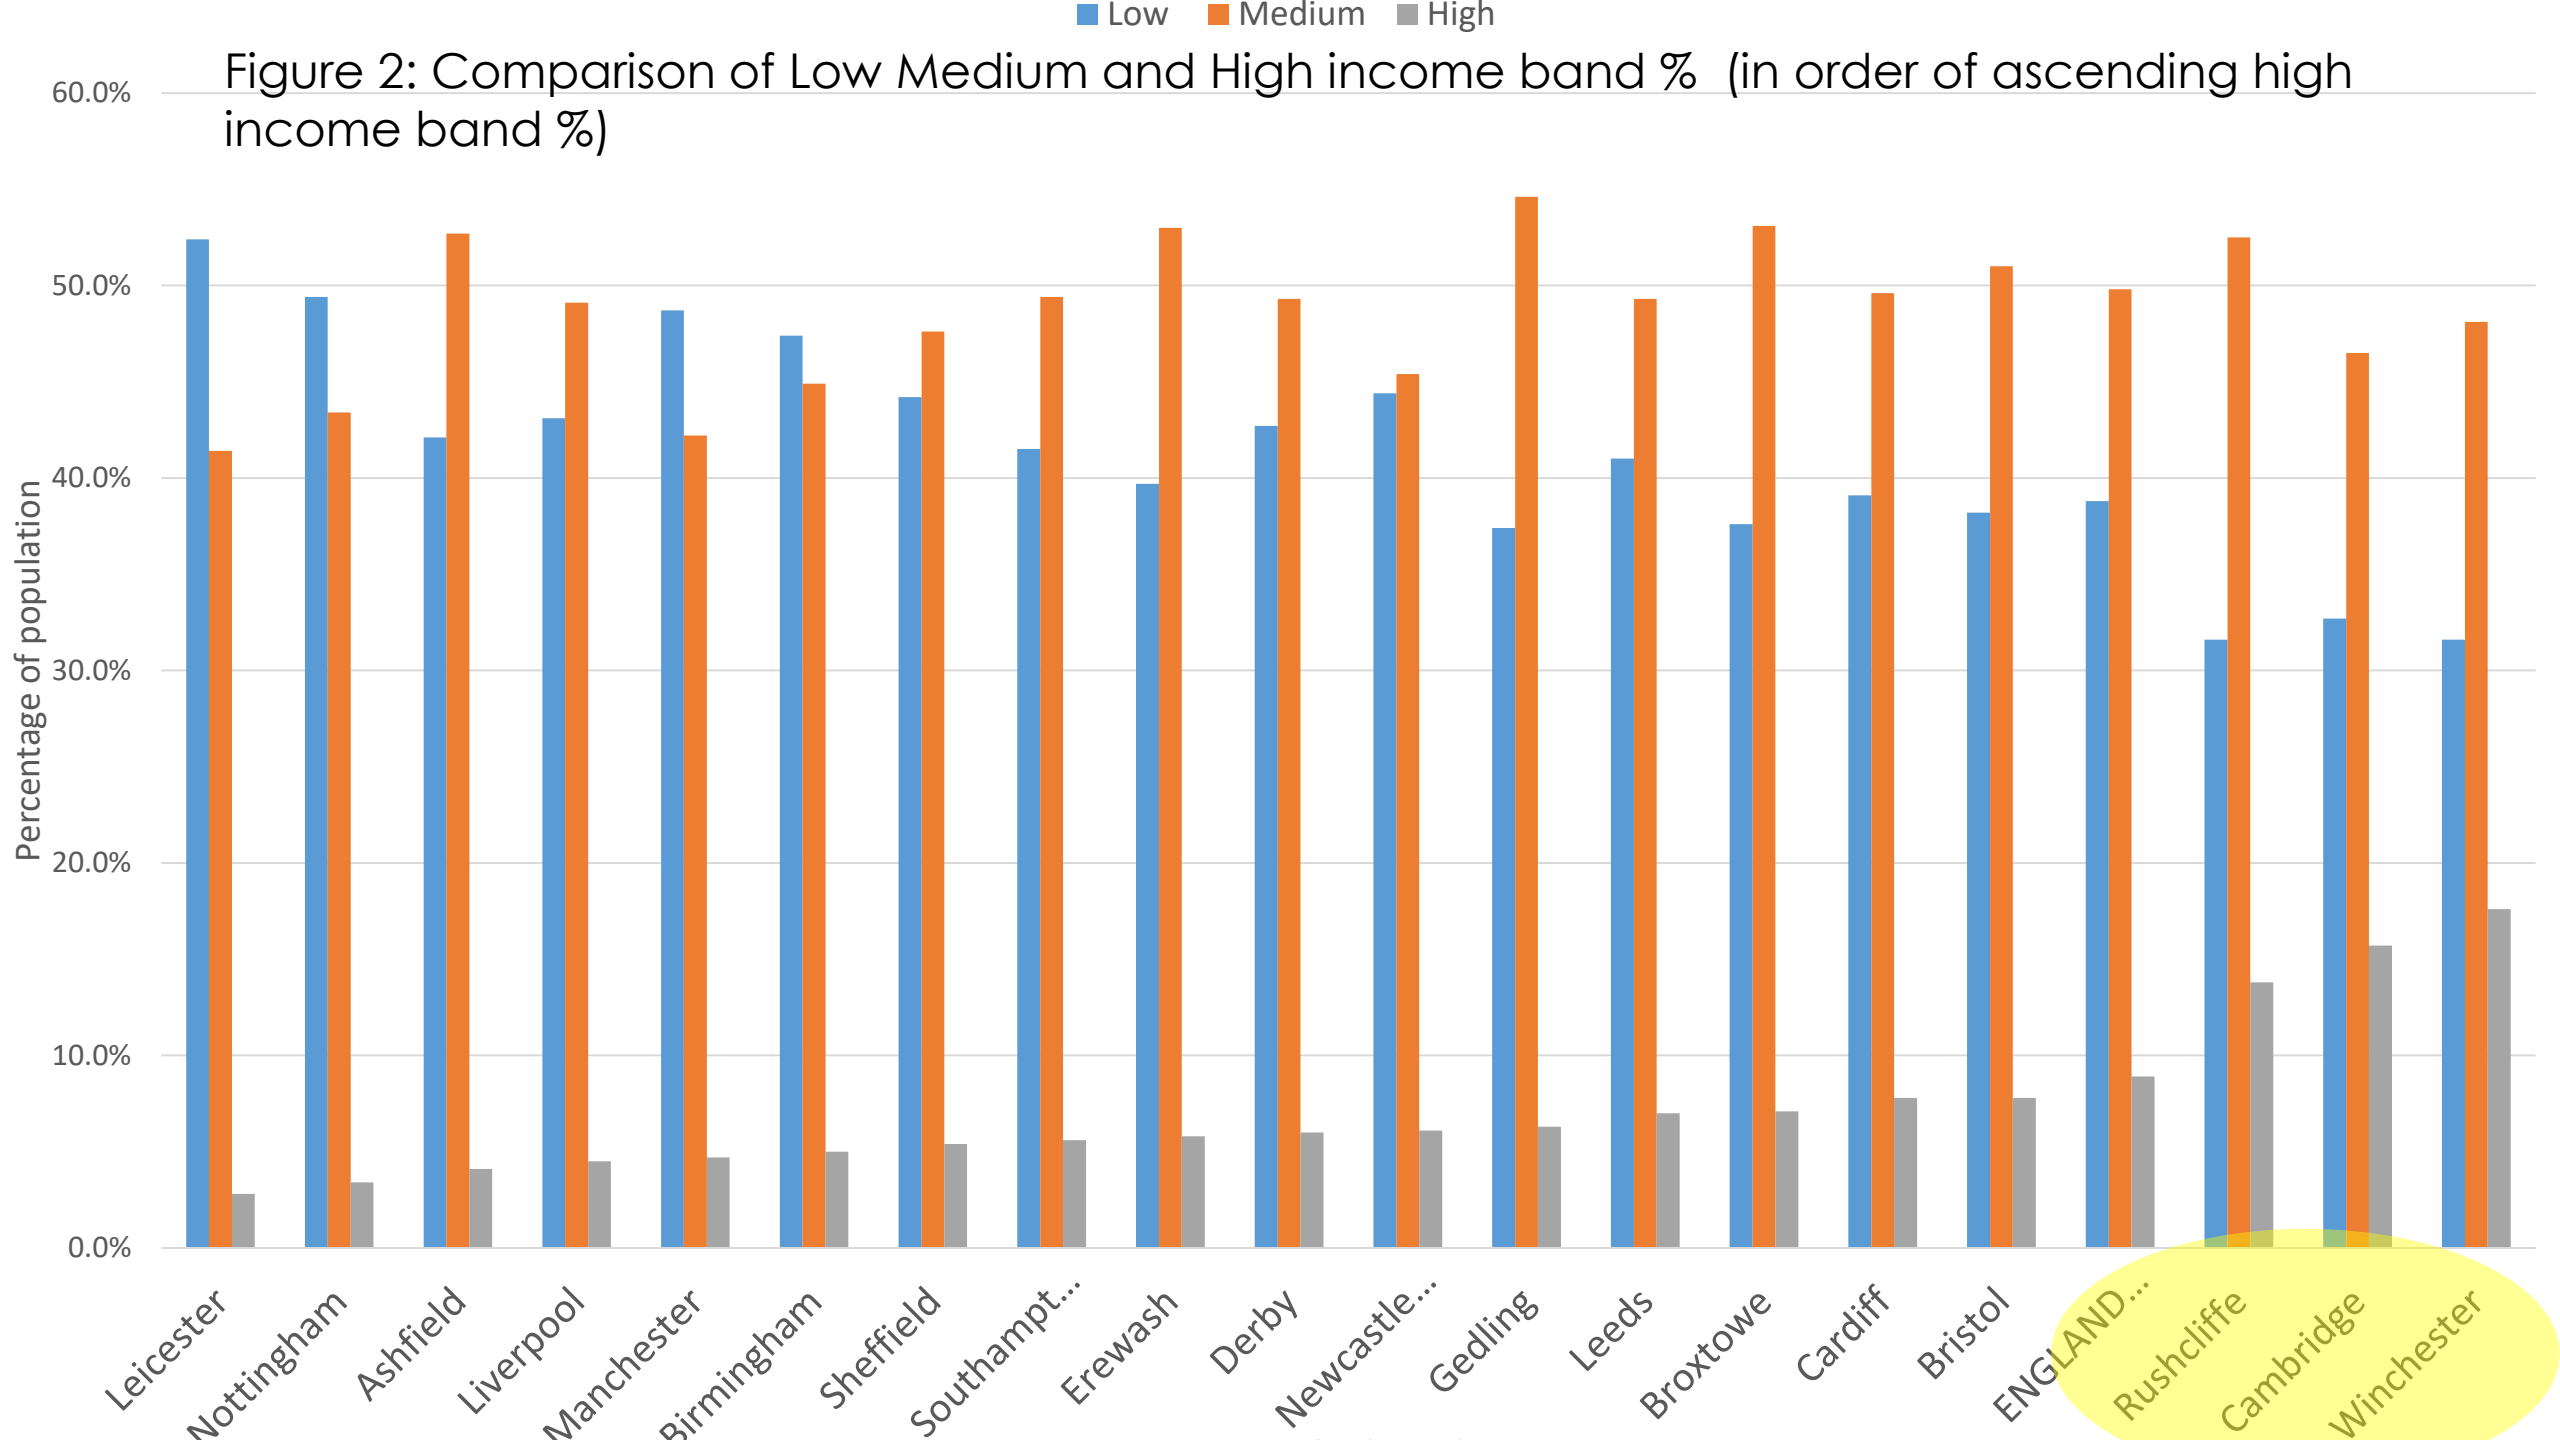

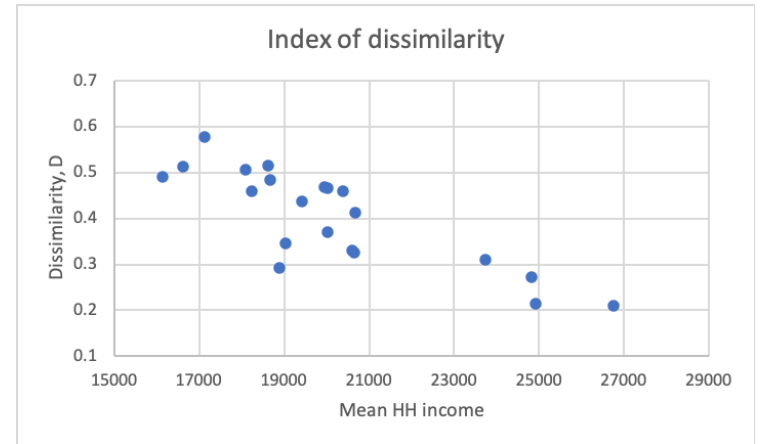

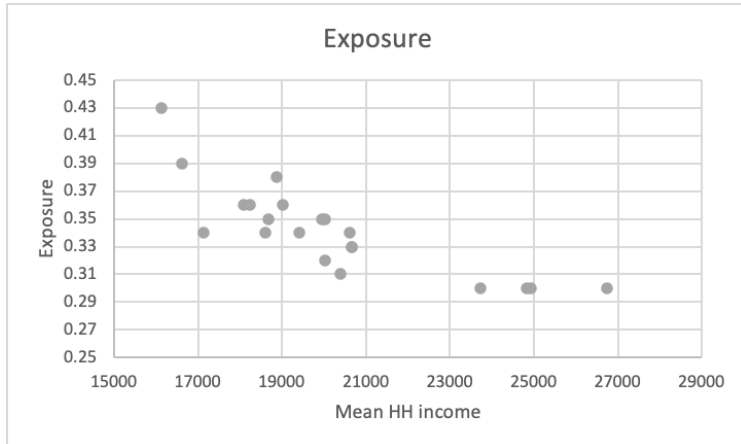

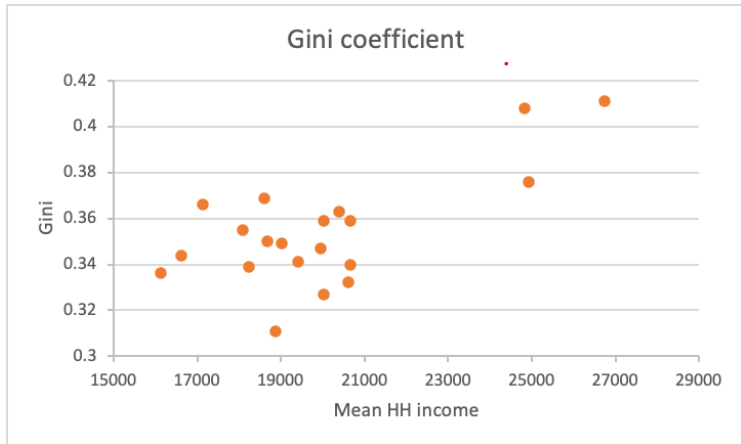

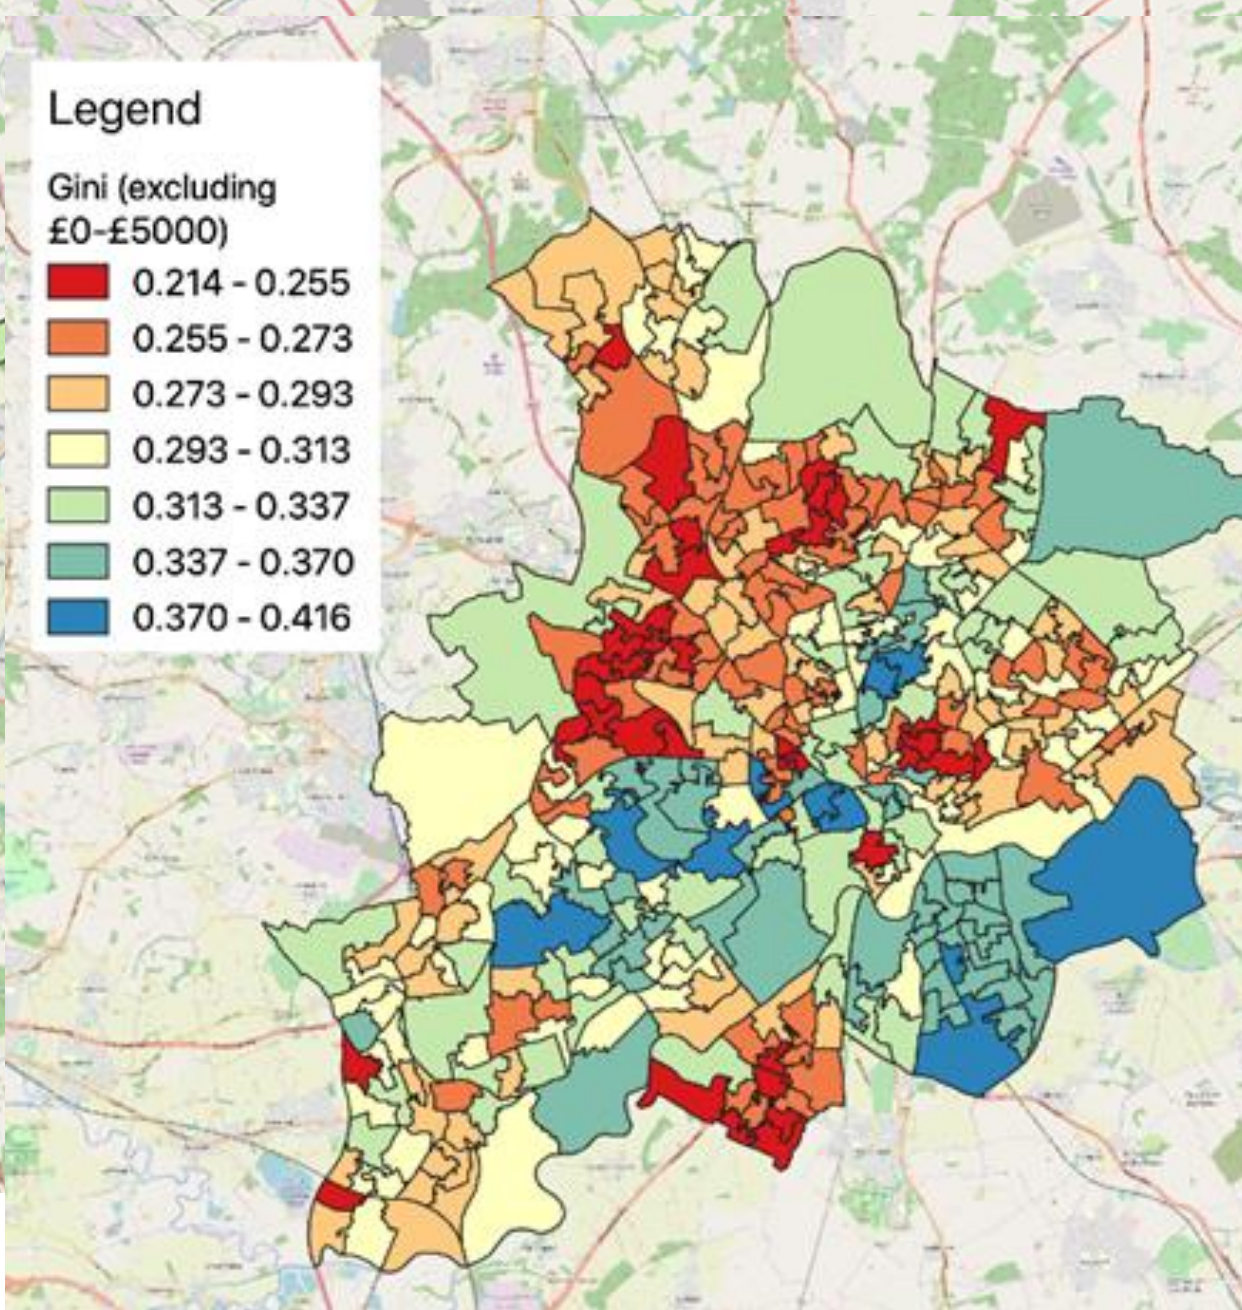

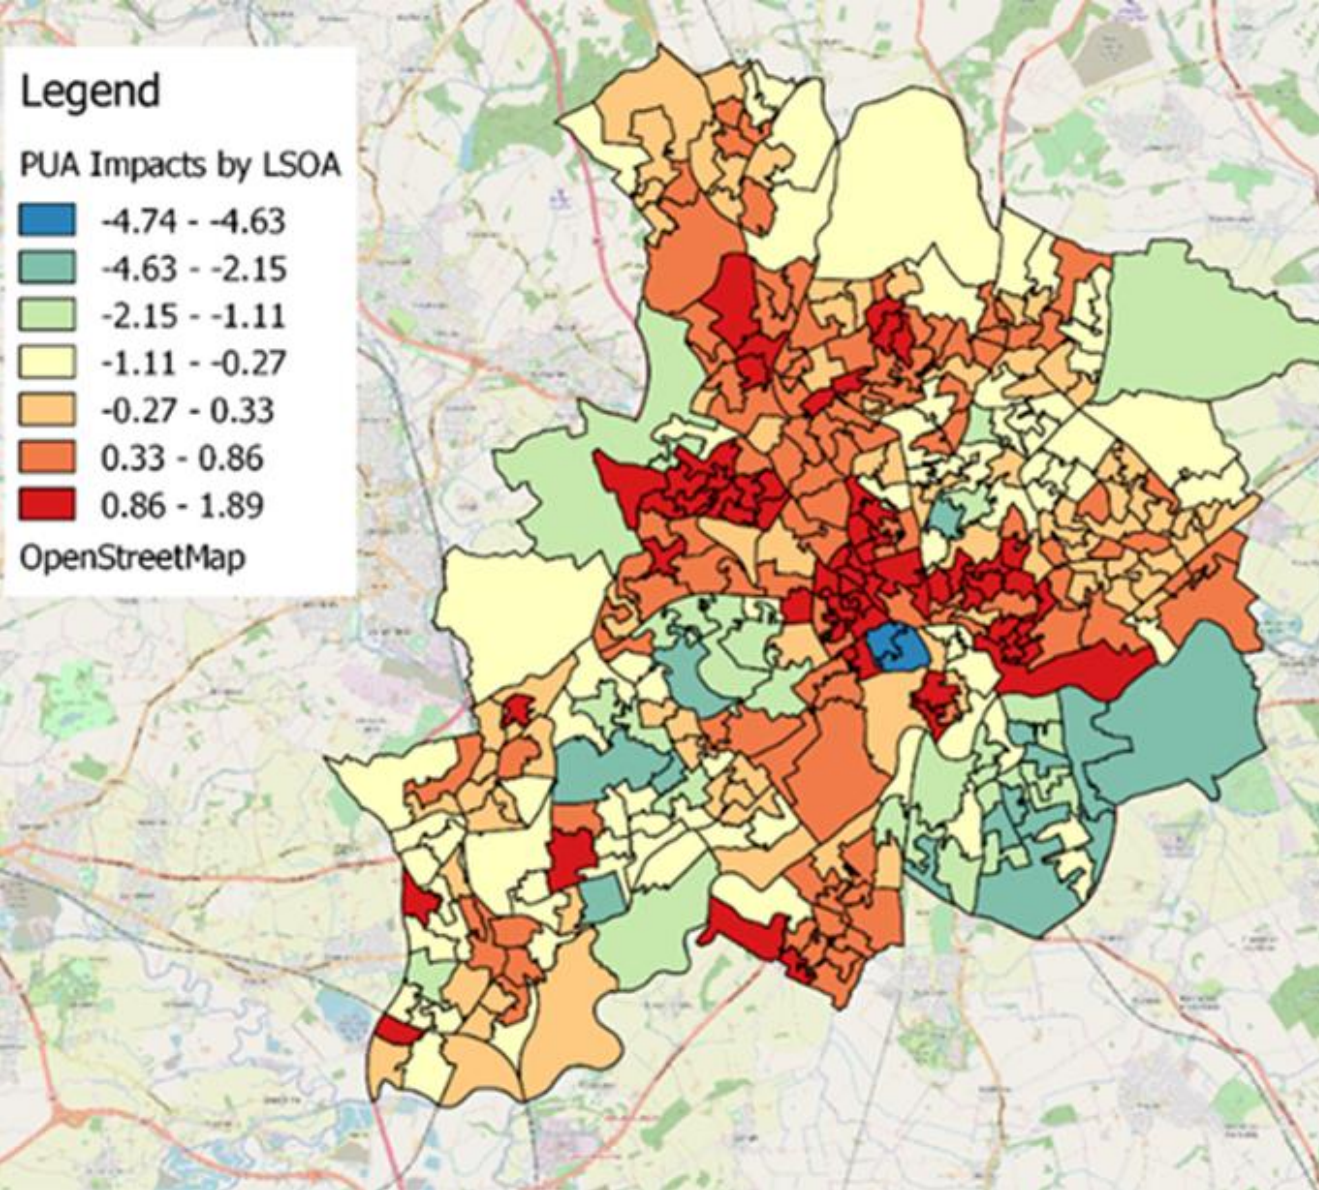

Figure 1: Gini coefficients, dissimilarity and interaction indices for case study areas of Nottingham and comparator UK cities (in descending order of Di value)

■ Low ■ Medium ■ High

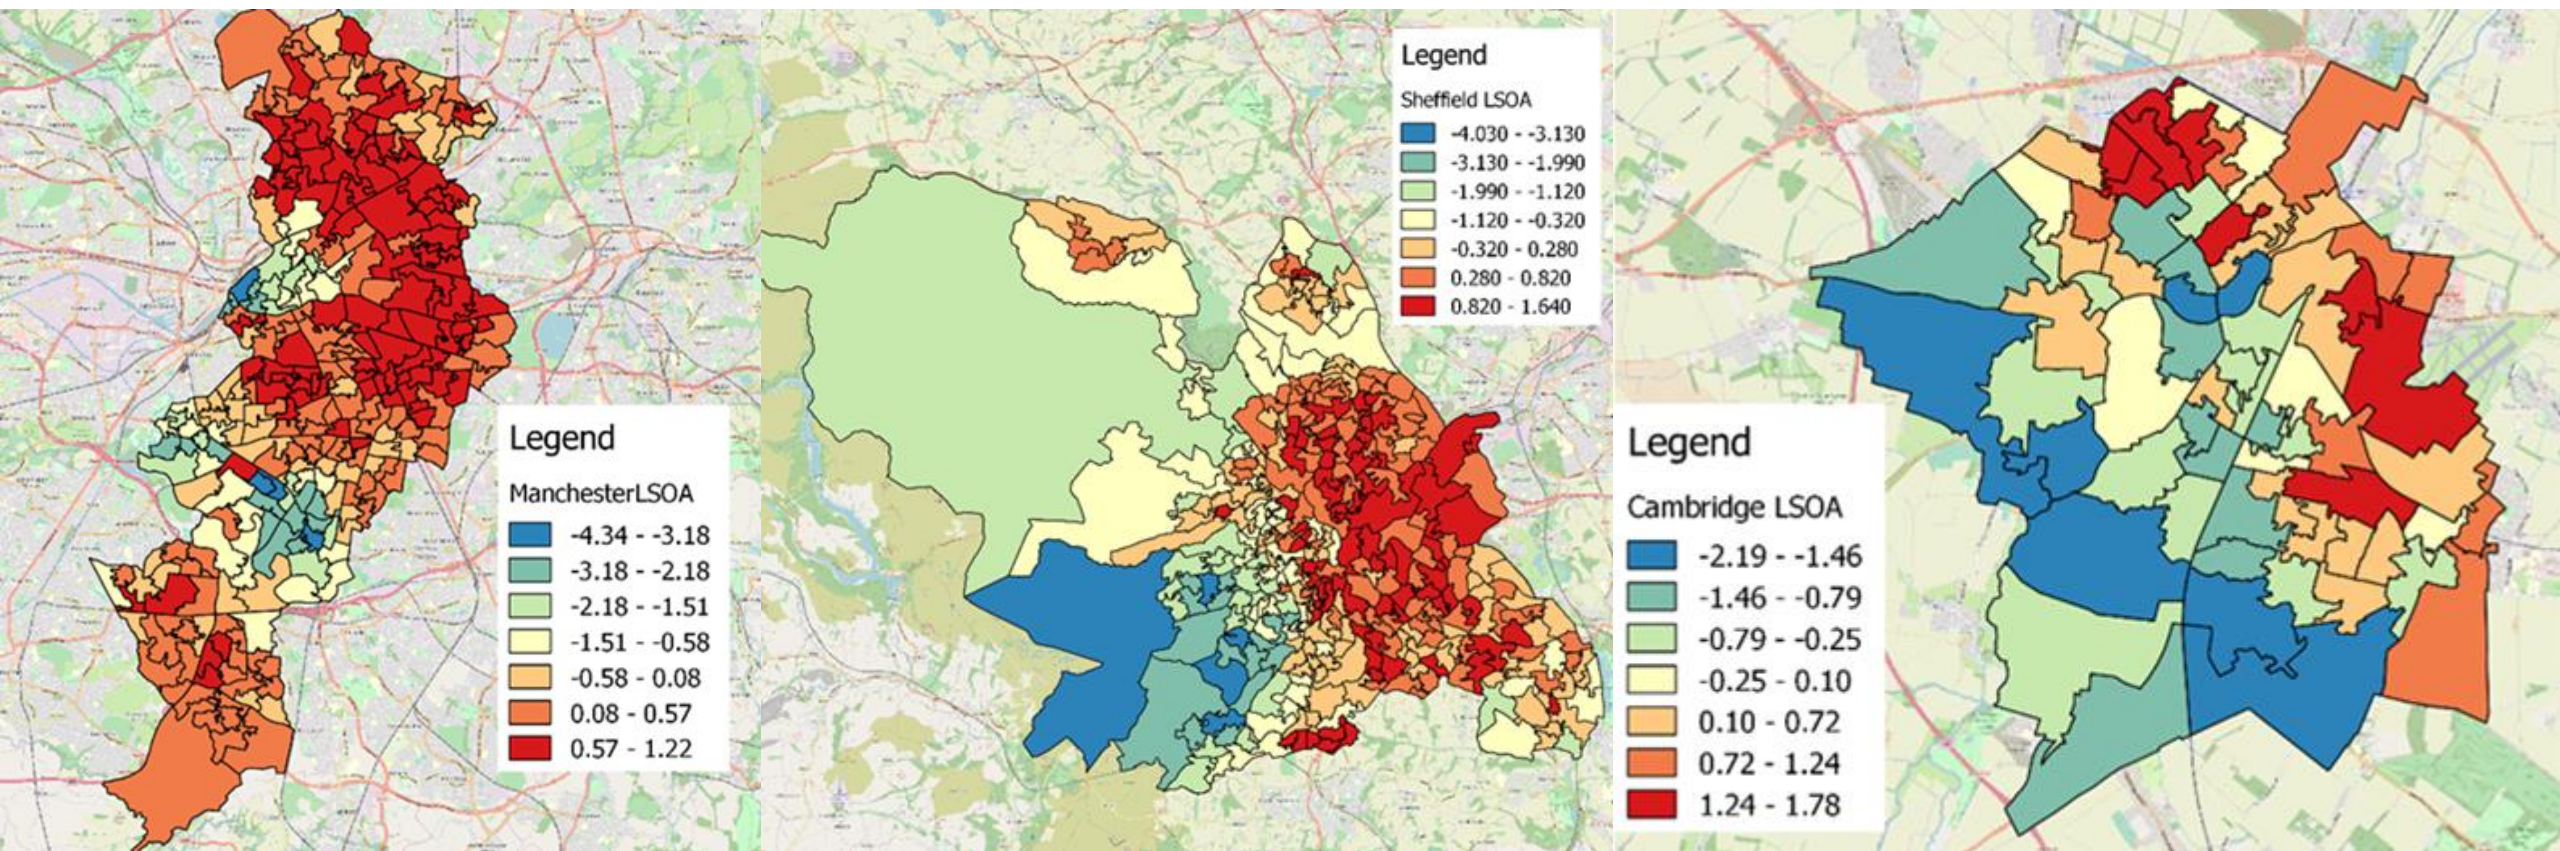

Figure 2: Comparison of Low Medium and High income band % (in order of ascending high income band %)

LSOA level impacts on the Dissimilarity index for the Nottingham PUA. Contains National Statistics data © Crown copyright and database right 2012. Backdrop mapping ©

LSOA level Di impact results for the cities of Manchester, Sheffield and Cambridge. Contains National Statistics data © Crown copyright and database right 2012. Backdrop mapping © OpenStreetMap contributors

Conclusions

- ▶ Data bias: high incomes are missing (“private”) cf. numerous ways to measure low income, to a high level of geographical precision
 - ▶ *Most research on income inequality is likely to underestimate it*
- ▶ High incomes have the biggest impact on segregation (Di) and inequality (Gini) in the cities studied
 - ▶ *Nb student populations*
- ▶ Affluent cities are different: higher Gini but lower segregation and interaction indices (“pockets of affluence”)
 - ▶ *Previous research overlooks income distributions?*
- ▶ High Gini LSOA = “mixed”; Low Gini LSOA = homogenous (almost always poor)
- ▶ In urban research, higher Gini is (very) tentatively “good news” – more suited as a measure of income mix (heterogeneity) rather than “inequality” (loaded term) – chimes with Glaeser et al, 2009 “inclusive economy”

Next steps

- ▶ Revisions underway
- ▶ Advocate for the utility of “**unevenness of household income**” in urban studies (pockets of affluence as well as deprivation)
- ▶ Applications for urban sustainability – particularly interdisciplinary synergies (NB new evidence of excess deaths linked to declining incomes, not deprivation, during austerity Darlington-Pollock, Simpson & Green 2021)

Thank you!
